Summary

This report was prepared as an update to Rural Alaska's Dental Health, prepared under contract to the Alaska Native Tribal Health Consortium in 2003 by Rider Consulting in consultation with Ron Nagel, DDS, MPH, Dental Health Aide Program, Alaska Native Tribal Health Consortium; Victoria Heart, MS, RN, CHAP Consultant, Alaska Native Tribal Health Consortium; Captain Jeanine Tucker, DMD, MPH; ANTHC Dental Consultant; Alaska Native Tribal Health Consortium; Dr. Murray Schwartz, Columbia University Dr. Brad Whistler, Health Program Manager, Section of Maternal, Child and Family Health, Department of Health & Social Services, State of Alaska; Pat Carr, Health Program Manager, Primary Care & Rural Health Unit, Section of Community Health & EMS, Department of Health & Social Services, State of Alaska; Laura Wertz-Stein, Health Program Manager, Primary Care & Rural Health Unit, Section of Community Health & EMS, Department of Health & Social Services, State of Alaska.

Determining dental need

The dental health of Alaskans is reportedly quite poor in much of the state. Alaska, as other states, experiences a shortage of dental health professionals. In some regions of the state, the quality of dental health is poorly documented simply because there are insufficient dental health providers to conduct the necessary examinations. The State's Dental Officer has received a federal grant to conduct a mouth-to-mouth survey of 3rd grade children, and the Alaska Native Tribal Health Consortium is conducting a similar effort in coordination with the state. It is their hope to gather information sufficient to develop strong oral health policy at the state and regional health corporation level. This work should be completed in late 2004.

Because this mouth-to-mouth data is not available, proxy data is substituted. Poverty is one indicator of poor oral health; the state's Medicaid program is a proxy data source. In the Community Profiles, a five-year average of children eligible for Medicaid is included for most communities.

Organization of the Report

Information about the fundamentals of funding dental facilities is presented in the first section of the report.

The Community Profiles contains information for considering applications for building dental facilities in each of Alaska's communities. The community information is organized alphabetically. Some federal programs such as the Dental Health Professional Shortage Area programs are determined at the borough/census tract level as well as at the community level; where applicable, the census tract level information is provided.

A chart at the end of the report ranks communities by Medicaid and IHS revenue sustainability.

Preparation of the Report

- This report was prepared using the following methods:
- reviewing the dental health equipment standards through a literature review;
- meeting with state and tribal oral health policymakers and professionals;
- securing and analyzing data about the private dental field through occupational licensing and dental clinics statewide;
- updating information on the Medicaid program from the state's Health Care Services Division;
- updating information on new Community Health Centers through HRSA;
- updating Dental Health Professional Shortage Areas as determined by HRSA;
- updating health provider information from the state Department of Commerce and Economic Development;
- updating Denali Commission projects involving health clinics by community from the Denali Commission Project Database;
- including information offered by dental chiefs responding to a survey in 2003.

Rules of Thumb

Sustainability

Sustainability by revenue

It takes about \$10,000 per month in revenues to make one dental operatory and staffing financially sustainable, according to private sector management consultants (Demaree, 1998; Homoly, 1999). Business plans should reflect anticipated revenues to demonstrate sustainability. A dentist producing significantly less could benefit from management help before proceeding with a new office (Demaree, 1998).

When dental service reimbursement is provided, real per-patient dental expenditures drop. Brown et al (2002) reviewed national medical expenditure data from 1987 to 1996, finding that costs per patient visit fell from \$529.93 in 1987 to \$467.29 in 1996. This is attributed to a shift from restorative care to diagnostic and preventive care.

Sustainability by population

If Alaska's costs were as low as the national medical expenditures found by Brown in 1996, 257 residents using Medicaid could sustain an operatory using a \$10,000 per operatory standard. However, all of Alaska's Medicaid reimbursements for dental care are higher than average national costs (DHSS, 2001).

Revenue sources

Two public funding sources consistently cover dental care: the Indian Health Service (IHS) and Medicaid. Business plans should identify potential revenues for each of these to the extent the population has these two as fund sources. In some communities, third party revenues such as private insurance plans is the primary payer.

Head Start requires a dental health component for each Head Start grantee. Dental services are provided within the Head Start facility when possible.

Indian Health Service

The Indian Health Service is chronically under-funded at a national level. Local IHS services are typically available at about 65 percent of need. Where IHS facilities or tribal health centers exist, they are beginning to rely more and more heavily on Medicaid and third party payers to stretch available funds. According to the U.S. Census (2000), the Native population is concentrated in some communities.

Table 1

Number of	Native
communities	population
25	0%
97	1-10%
40	11-30%
28	31-60%
30	61-80%
123	81-100%

In communities with high numbers of Native residents, IHS funds will continue to be a major payer for dental care. To the degree that children are Medicaid-eligible, these two sources could demonstrate economic sustainability for a clinic. In 120 of the 174 communities with 40 percent or higher Native population, more than ten percent of the children are Medicaid eligible as well.

If the Indian Health Service funding were to increase, it could provide necessary base funding for dental health providers serving rural Alaska. However, from 1992-1999 the IHS reported a 26-percent reduction in the number of individuals receiving dental services.

The Indian Health Service RPMS client data does not include payment sources. This makes it difficult to identify how Indian Health Service facilities are billing third party payers. However, tracking this type of information and projecting future billing will become more common in coming years.

Medicaid

Alaska has higher reimbursement for some dental services than do other states (State of Alaska, 2002). However, these reimbursement rates often do not mirror private pay rates. Because of this, Alaska has a lower level of dentist participation in the Medicaid program than desired. This is not uncommon among state Medicaid programs. Of 39 states providing information about Medicaid participation, 23 reported that *fewer than half* their state's dentists saw any Medicaid patients during a year (GAO, 2000). Dentists nationwide have contemplated administrative changes that would improve Medicaid acceptance rates.

At present, most states are struggling with their Medicaid funding levels. Medicaid costs have increased substantially in the last few years, and despite some federal incentives in 2003, many states including Alaska are faced with reducing Medicaid coverage as a cost containment measure. For example, many states are using formularies to contain pharmaceutical costs. However, Medicaid coverage for preventive care—such as preventive dental services for adults—often takes a back seat to emergency care, which is more costly. This occurs despite the predictability of costlier emergency care in lieu of preventive services.

In 2003, several legislative actions changed the way the Medicaid program works in Alaska. A few have direct impacts on reimbursement for dental care.

Options list moved from statute (legislative authority) into regulation (Commissioner authority). The federal government, in its partnership with states on the Medicaid program, has a few minimum requirements of services that states must fund in order to participate. All services to income-eligible children are mandated, although the income eligibility is determined by the state. Scope and duration of optional services are, and have been, under the direction of the Commissioner of the state Department of Health and Social Services. With this change in statute, whether services are funded at all and the order in which services are restricted are directed solely by the Commissioner. This responsibility includes adult dental care, funded in 2004 at an emergency-only level of care. Dental services for adults are not on the federal government's list of minimum services. Until this past year, dental services have been ranked by the legislature along with other Medicaid-fundable services.

Reduced eligibility for the Denali KidCare program. The legislature decreased the level of poverty that allows a person to be eligible for Medicaid from 200 percent to 175 percent of the 2003 Federal Poverty Guidelines This action reduces the numbers of pregnant women and children eligible for all Medicaid services, including dental care.

Statewide, the total reduction of eligibility fore Denali KidCare includes:

	FY04	FY05	FY06	FY07	FY08	FY09
Pregnant	123	140	57	173	180	205
women						
Title XXI	1,213	1,380	1,544	1,704	1,861	2,014
children						

Denali KidCare

Alaska's Medicaid program pays for dental care to income-eligible residents, 18-years and under. In some communities, Medicaid appears to be the most frequent payer for dental services:

Number of communities	Medicaid -eligible children as
	percentage of total population
74	10-20%
38	21-30%
18	31-40%
5	42-58%

Five years of Medicaid data were reviewed for certain communities in Alaska. The higher the child Medicaid eligibility rate, the higher the likelihood of Medicaid as a factor in sustainability of the dental operatory. Some communities with high percentages of Medicaid-eligible children also have relatively high populations.

Table 2

Community	Total	Medicaid eligible
	population	children as a
		percentage of
		total population
Wasilla	5,470	50%
North Pole	1,570	52%
Delta Junction	840	<i>55</i> %

Medicaid dental coverage for adults

Adult Medicaid coverage is, at present, not a viable source of sustainability for dental operatories. Should that coverage be increased in services, scope and duration, it could become a positive sustainability factor. However, even emergency dental services to adults are at risk of elimination under the state's current Medicaid plan.

Alaska's uninsured adults suffer from severe dental care problems. However, the state Medicaid program covers only emergency care for adults who are Medicaideligible. According to the U.S. GAO (4/00), this puts Alaska in the company of seventeen other states, eight of which offer less than emergency dental care. In these states, dental emergencies are usually addressed at the hospital emergency room, where the ER physician may treat the result of the dental problem (abscess, pain, etc) rather than the cause (infected tooth).

Consequently, reoccurrence of the problem continues until the root cause is treated.

In Maryland, adult dental coverage was eliminated in 1993. In the first year after making this change, the rate of dental visits to emergency rooms by Medicaid recipients increased by 21.8 percent at a time when all other emergency room visits by Medicaid recipients was decreasing (Cohen et al.; 1996). Over a four-year period, the increase in rate of claims was 12 percent higher than when emergency dental care was covered (Cohen et al., 2002). In Alaska, one Native health provider reviewed its medivac claims and found that one-third of medivacs to emergency care in Anchorage from remote islands were related to dental issues.

IHS Medicaid

The topic of IHS Medicaid has some small impact on dental care, but far more on other aspects of health care provision statewide. This brief discussion is provided because to the extent, dental health is colocated with primary health care.

Using the state's Medicaid system, the federal government reimburses each Medicaid dollar at 100 percent for an IHS beneficiary receiving services within the health care setting of an IHS facility or that of a 638 contractor/compacted entity. There is no cost to the state for Medicaid-reimbursed services provided in this setting.

In FY02, \$167 million was spent on Alaska Natives through non-Native providers. Over \$40 million of that Medicaid expense was state general fund dollars, which would not have been the case if Native providers had billed for the services. The state Department of Health & Social Service has embarked upon a Tribal Health Agenda, designed to encourage the collaboration of non-Native health, disability, and behavioral health providers with Native providers to maximize the federal reimbursement potentials of IHS Medicaid. A number of legal issues are being addressed at present.

Workforce Issues and Incentives

Declining dentistry

As with some other health professions, dentists are in high demand nationally. The number of dentists per 100,000 population is declining to the workforce level of over 50 years ago. Efforts to increase the number of dental professionals and paraprofessionals vary nationally. Where possible, expansion of services provided by lower level professionals and paraprofessionals can help

Dr. Richard Valachovic in a 2001 presentation to the National Governor's Association Policy Academy explained the dire situation for the dental professional workforce.

Table 3

Number of dentists per 100,000	year
51.6	1950
59.5	1990
52.7	2000

The decreasing number of dentists per 100,000 population from 1990-2000 is based on the decreased number of annual dental school graduates, dentists retiring and changes in population. Projections indicate the number of dental school graduates will not offset the number of retiring dentists in the next decade. Seven dental schools closed in the late 1980s and early 1990s and other schools reduced class sizes – the overall annual dental student population declining by 40% from its peak in 1983. Only one new school (Arizona) has opened since that time. Dental schools are also struggling to keep adequate dental school faculty with 344 vacant faculty positions in the nation's 54 dental schools (Krause, 2002).

Recruitment and retention of dentists and hygienists showed time and time again as a significant barrier in the survey of dental chiefs. In rural states that already experience serious dentist shortages, alternative approaches can help stem the tide. Within the state, the Dental Health Aide and Dental Hygiene Technology programs are doing just that.

Expanding the paraprofessional workforce

The Alaska Native Tribal Health Consortium has embarked upon an ambitious training program for dental health aides and therapists. These paraprofessionals are being trained statewide, based upon comprehensive certification standards. Standards have been developed in conjunction with the field, based on internationally successful programs. It is early to consider dental health aide placement in the determination of whether or not to fund a dental facility (Dr. Ron Nagel, ANTHC, personal communication November 3, 2002; October, 2003).

Most sub-regional clinics would like to have a dental health aide or eventually a dental health therapist on staff. The Dental Hygiene Technology Program at the University of Alaska has a similar mission.

These programs can greatly enhance Alaska's dental workforce, but without some State rule changes the effectiveness of the Dental Hygiene Technology Program are limited. Other states are in a similar situation, and are changing their regulations and laws to maximize independent services and reimbursement for auxiliary personnel. The Alaska Dental Society has some concerns about expanding the authority for paraprofessionals.

Initiatives in Other Regions of the Nation

Loan repayment programs

Some states (Colorado, Minnesota, and Maine are examples) offer loan repayment programs to dentists who agree to practice in underserved areas. In Colorado, the program is available to dental hygienists as well, as is a tax credit program. Some states are trying to attract retired dentists to fill gaps as well. Minnesota reimburses some providers at a higher Medicaid rate if they receive a "critical access" designation. Other states are providing incentives for dental training specializing in children and patients with special needs.

Reducing restrictions on dental hygienists and assistants

Auxiliary personnel are widely understood to be critical in addressing dental health care, particularly with the dental professional shortage. However, their scope of practice can be restricted unnecessarily. Several states are changing their laws or regulations to permit dental hygienists and assistants to provide preventive services without a dentist's supervision (Krause). Colorado, Maine, Minnesota, and Missouri changed laws to expand the purview of dental hygienists providing preventive services. Three of these states permit independent work in public health centers, while one permits independent Medicaid billing for services to certain populations. Alaska has not made that change, and several responses to the dental survey refer to that restriction as a barrier to hygienist services.

National Incentives

Dental Health Professional Shortage Areas

The federal government establishes Health Professional Shortage Areas (HPSAs) for dentists, mental and behavioral health, and primary care. Factors involved in establishing shortage areas include professional to population ratios; access to care, and poverty among other factors. The population to provider ratio, however, does not always account for need as effectively as it might. In some areas, the severity of

dental health could be significant. Further, Community Health Center designation does not automatically mean dental health professional shortage area designation despite the similarities in the programs. This means that federally designated Community Health Centers must also receive a separate designation in order to participate in the Dental HPSA program.

Staff of the Community Health and Emergency Medical Services, Division of Public Health, have been documenting Health Professional Shortage Areas in Alaska. These areas are designated by the federal government as being eligible for certain incentives for potential employees that help reduce the shortage in that region. Other census areas are potentially eligible as Dental HPSAs.

National Health Services Corps

The National Health Services Corps (NHSC) provides loan forgiveness to participants. Funding for NHSC has remained flat, and has not been recommended for expansion by the Health Resources and Services Administration due to competing priorities. The program is stretched to capacity in all disciplines, and to increase dental health as a priority means a decrease in other primary care. The National Health Services Corps is piloting a dental scholarship program with certain dental schools as an incentive to train dentists to work with vulnerable and low-income populations and as an incentive to developing practice sites for students upon graduation (GAO 2000). This small program can be increased in size, and the Corps itself can be increased to accommodate needs overall.

Health Care Safety Net Improvement Act

This bill reauthorizes the National Health Services Corps, the Community Health Centers program, and establishes a Community Access demonstration program. It includes five-year incentive grants for states to develop innovative dental workforce development programs specific to their individual needs to improve access to oral health services in dental HPSAs. States receiving federal funds would have to match at least 40% of the grant.

IHS loan repayment

The Indian Health Service provides some loan repayment awards as incentives for working in their facilities, a program which has diminished in size by half between 1995 and 1999 from 20 to 11. The dental loan repayment program competes with loan repayments to other professions, and in fiscal year 2000 was increased from ten to 15 percent of the total value of the loan repayment program. Close to 60 percent of dentists leave the Indian Health Service before they have completed their duties. About one-quarter of IHS dentist positions were vacant in April 2000, according to the General Accounting Office in 2000 (p. 21). Non-competitive salaries are the primary reason for IHS dentist

vacancies. IHS dental salaries start between \$50 to \$60,000 per year, whereas salaries in the private sector start at about \$80,000 per year.

Implications for dental health facilities

As technology advances, efficient office design becomes more important. The dentist and hygienist must be able to incorporate new technology into existing space (Byers, 2000). Unthank suggests that dental office planning anticipate auxiliary staffing (1999) Ahearn suggests that design enable two-handed function.

Space considerations

Size of an operatory

In building dental operatories, the private practice literature is clear - there are scales of order that greatly improve the dentist's (and presumably the hygienist's) productivity. Where in some fields more space is better, in building operatories, less is more. The most valuable commodities in the room are the dentist's time and energy. The fewer steps the dentist must take between the chair and essential supplies means the dentist has more available energy and time to devote to each patient (Ahearn, 6/02).

"a careful assessment of practice numbers—including procedure analysis—will provide good indicators for your appropriate design targets. The goal is to create a patient flow that allows for high efficiency while preventing bottlenecks." Ahearn (4/02)

Keep it small, 10x10 or 10x12

- The most efficient operatory requires less movement of its users.
- Smaller operatories have decreased plumbing and electrical costs per operatory (Ahearn 5/02, 7/02).
- 475 square feet per treatment chair determines the total net area required for a dental office, including reception and business functions as well as operatory, lab, and sterilization. Unthank and True (1999 [2])
- To add in square footage of land for the building, parking, landscaping, & water retention areas, apply a multiplier of 7 to the net square footage. Unthank and True (1999 [2])
- There is a significant difference between an operatory that is 10-feet by 10-feet and another that is 10-feet by 12-feet. The larger operatory is less workable, requiring more effort and reducing efficiency. Dr. John Miley (personal communication, 11/02; Dr. Mark Kelso (personal communication, 11/02).
- Dentists and CEOs of community health centers, desired a 2-operatory room of 10'x20' in order to accommodate two patients, at a minimum.

The VA & DOD methods

DOD and VA space criteria are primarily focused on large dental clinics composed of multiple operatories and ancillary services (laboratory, radiology) and located within inpatient facilities. The DOD/VA planning criteria better resembles dental clinics located in hospitals, rather than primary care clinics located in small communities.

The Veterans Administration (VA) includes administration and related functions as well as staff training in its space standards. Its outpatient dental care determinations are based on multiplying the number of visits by 0.00046 and combined with other calculations to determine the size of a facility.

The Department of Defense allocates one and a half treatment rooms for each general duty dentist, and two are allocated per specialist. A hygienist is allocated one treatment room. Space must be justified by independent study. A treatment room is scheduled at 120-square feet, or ten feet by twelve.

Room design

- The room should be made to accommodate both dentist and hygienist services, and that accommodate each in solo practice (Ahearn, 6/02).
- Include symmetrical secondary work surfaces in the operatory; dentists and hygienists are both right- and left-handed.
- By using room pairs, one for hygiene and one for dentists, an office may save up to 30 percent of its space. Ahearn (2000)
- All treatment rooms should be built and equipped the same to avoid having "favorite rooms" ((those tailored to a specific provider preference) (Byers, 2000)).
- Orienting the patient chair away from the treatment corridor provides a feeling of privacy and keeps the dental equipment away from the patient's view.
- Excellent sound control is a high priority to improve privacy and decrease patient anxiety. Ahearn (5/02) states that wall composition, door and window placements, and ceiling and wall coverings are all part of acoustical planning.

Access

- Adequate space for the flow of people and technology is a priority. Disability access for patients and staff must be accommodated. Dental staff should be able to move freely from one operatory to another, and to and from the supply and laboratory (Unthank, 1999). There should be egress for mobile units and space for cables (Ahearn 7/02).
- The lab should have doors.
- Sterilization and re-supply should be open to clinical space (Ahearn, 4/02).
- Sterilization should be closely placed to the treatment area to most rapidly reintroduce sterilized equipment (Ahearn 6/02, Byers 2000).
- Sterilization and re-supply areas should be centrally located (Ahearn, 4/02).

- Storage should be centralized (Ahearn, 4/02) to allow practitioners easiest access to supplies.
- Storage should be hidden from patient view.
- Within the operatory, all supplies should be consolidated with a 90-degree angle reach of the assistant (Ahearn, 6/02).
- Unthank (1999) supports the compact treatment room design. He states:

'Ideally, the instruments and materials necessary for treatment should be delivered and retrieved by an assistant without the dentist having to shift focal length or leave the finger rest. To have an unobstructed view of the oral cavity, the assistant should be seated approximately six inches higher than the dentist and with his or her thigh paralleling the adjacent upper arm of the patient. This allows the assistant to see over the indirect vision or checkretracting hand of the dentist while maintaining proper posture."

In Alaska, we have additional construction challenges. Plumbing, water pressure, electricity, and ventilation [where nitrous oxide is used] are critical components of dental operatories. These issues, and the logistics supporting these issues (availability of community water, power, sewer) must be addressed when developing operatory design and placement.

What doesn't work

- Operatories that are physically removed from each other (down a hall or one room over) reduce efficiency.
- A laboratory that is too far from the operatory slows down productivity (Ahearn, 4/02).

Locations

Respondents to a survey of dental providers as well as and dentists at the Dental Chiefs meeting, agree the best place for an operatory is where their clients are. Who are the clients, and where are they?

Similarly, housing for itinerant staff should be closely located to the dental operatories.

Every community has unique characteristics based upon their geographical location and demographics. Local health organizations, combined with community leaders, should determine the type of dental facility that best services the community.

Health clinics

Health clinics provide a physical and staffing infrastructure that can be of significant assistance to dental providers. Getting the primary clients—schoolaged children—to the clinic for dental care can mean missed appointments, however. Health clinic location near a school can solve several problems.

Schools

Their primary clients are school aged children. Where possible, health clinics with dental operatories could be located within, or nearby, schools.

Head Start

The federal Head Start program has a dental component that pays for preventive services to children enrolled in Head Start. Dentists can and should provide dental care to children at the Head Start program. Rather than invest in new fixed equipment, a hybrid model of assemblage can be used here.

Fixed, portable, or hybrid equipment?

In Alaska, portable operatories are commonly used to provide services to rural communities. In some communities, these portable operatories offer the most reasonable and flexible methods of service delivery.

Fixed

Fixed equipment is placed in a room permanently and exclusively dedicated to dental care.

Portable

"Portable equipment" does not refer to a mobile operatory. This equipment may be wheel-based or carried (Meyer & Eikenberg 2002). Ahearn (5/02) states that basic high technology should be embedded into each operatory, whereas specialty technology that may be moved from one operatory to another. Mobile equipment is not designed to be transported from one office to another, but within an office.

Meyer and Eikenberg (2002) suggest that portable equipment should be light enough to be carried by one person in its shipping container, and small enough to be transported on a commercial airliner. However, this does not take into account the limitations of smaller aircraft servicing rural Alaska. Meyer and Eikenberg describe in detail the equipment and supplies necessary for a portable operatory in a mission setting.

Dentists are concerned about the amount of time and effort it takes to transport and set up a portable operatory. They alone are responsible for transportation of the equipment, cleaning space for set-up, and taking the time to set up equipment. In a workforce environment where dental skills are scarce, they believe that setting up and taking down a portable operatory is not the best use of their time. This premise supports the need for pre-positioning equipment in remote communities and training "on-site" staff in the art of assembling and function testing portable dental equipment prior to a itinerate dentist's arrival. It also points to the utility of a hybrid equipment assemblage in lieu of portable equipment.

Hybrid operatory: suitable for a room used for more than one purpose

A hybrid operatory is mobile within the individual clinic, but which can be moved into a secure location that permits the use of the room for other purposes when a dental professional or paraprofessional is not providing services.

The hybrid concept involves establishing *multi-use rooms* within an existing facility (health clinic, school, etc.). This layout may entail one large room, or two rooms with a movable, or accordion, wall [that allows for two rooms to be converted to one larger room]. Dental

equipment may be permanently installed in on room, while a duplicate set of equipment, stored on-site, can be [temporarily] installed in the adjoining room, when dental services are being provided. This allows providers to work with traditional "permanent" equipment, while allowing for a portion of the dental operatory space to be used for other functions when dental services are not being delivered. It is likely that, given more information, more dentists and CEOs would indicate a preference for the hybrid model—perhaps in lieu of relying totally upon permanent or portable operatories for a specific community.

- 10: Number of villages best served by a portable operatory only
- 13: Number of villages best served by one permanent and one portable operatory
- 10: Number of villages best served by a hybrid operatory

Commercially purchased equipment list

Dental equipment is changing mostly in radiology. X-ray is being rapidly improved by the use of digital equipment. Digital radiology is roughly the same cost as a dental x-ray and film processor combined.

Component	Estimated Cost	Subcomponents & Function
Dental Operatory System	\$11,500	Consists of operatory chair, provider stools (x2), 3-handpiece controller, cuspidor, operatory light. For providing patient exams and treatment
Mobile Cart System	\$ 2,500	Mobile handpiece controller & instrument table. Alternative to top-post mount system included in above component
Dental Vacuum	\$2,500	Provides suction to cuspidor
Dental Compressor	\$3,500	Provides pneumatic power to handpieces
Dental X-ray	\$3,000	Provides radiographic images of teeth
Film Processor	\$2,500	Develops radiographic film
Film Viewer	\$ 500	Allows provider to view radiographic images
Dental Sterilizer	\$2,500	Sterilizes dental instruments
Ultrasonic Cleaner	\$500	Cleans dental instruments
Dental Scaler	\$500	Utilized in dental hygiene procedures
Light Curing Unit	\$500	Utilized in dental procedures
Misc. handpieces & instruments	\$5,000	Utilized in dental & dental hygiene procedures
Dental Casework (cabine, sink, & counter unit)	5,000	Stores instruments, small equipment, holds sterilizer & cleaner
TOTAL Estimated Cost	\$40,000	

Community profiles

Each community profile includes information about potential clients, sustainability, publicly funded providers and private clinics, dental health workforce, and local considerations including public operatory needs, Denali Commission funded projects, and notes from dental health chiefs.

Many community profiles have no data in several fields. Where the data is about a type of clinic or days of service per year, a blank space means the information was not available. Where the data refers to all professionals or private clinics, a blank means that at the date of publication there was no dental health worker or private clinic in the community.

[1] S-year average derived from monthly census of Medicaid-eligible children by community, 1996-2001.
[2] IHS eligibles individuals of Indian and Alaska Native heritage who could qualify as Indian Health Service heneficiaries. The Indian Health Service provides some funding to pay for costs of dental care to IHS heneficiaries.

[3] Section 330 grantees updated 1/04 from HRSA database.

[4] Private dental clinic information secured from ACS Yellow Dages database updated 1/04.

[5] Residence of dental professionals secured from the State of Alabas, Division of Occupational Licensing, updated 1/04.

[6] Secured through sweep of IIIs and CHC dental chiefs completed 1/03.

[7] Dental HPSA: Dental Health Professional Shortage Area: The U.S. Health Resources Service Agency works with states to determine health professional shortage areas based on lack of health care professions or very low income areas. These designations are used to determine incentives for providers to relocate and provide services.

[8] FTE: Full Time Equivalent. In a Dental Health Professional Shortage area, 0.6 FTE shortage means that the region could benefit from a dentist at 60% of full-time work hours.
